About

I've spent 9+ years building and running products across fintech, SaaS, CRM and developer tools: Darkhorsestocks, the ShinobiData analytics platform, a multi-channel CRM, a hospitality business taken fully online, and a production platform for a paying client, each owned end to end.

What ties them together is an eye for detail. I care about how long-form data is presented, making dense financial information clean and readable without losing depth, and about interfaces that look better because they work better. When something I've learned is worth sharing, it goes back to the community, including contributions to OpenMLS, the Rust end-to-end encryption library.

•

Owned product vision and roadmap for a print-on-demand fulfillment platform and built it end to end: a TypeScript Turborepo monorepo (Next.js 16, Prisma 7, Neon PostgreSQL, Auth.js v5) with 45 models across 9 domain modules, multi-tenant seller workspaces, single-account Stripe with idempotent signature-verified webhooks, and a 7-language dashboard, live at opcreative.us.

•

Ran a zero-downtime cutover off the legacy production system (65+ products reconciled), then a nightly checksum-verified delta sync; cut order-search latency 95% (627ms to 30ms) on serverless Postgres and added an AI assistant with permission-scoped tools and forced structured output.

•

Designed and led product for a Bloomberg-style equity research platform: 10,000+ NYSE/NASDAQ tickers, 20+ years of prices, 5+ years of fundamentals (Next.js 16, PostgreSQL, Apollo, on AWS Fargate).

•

Launched 200+ screening parameters on a denormalized, composite-indexed snapshot table for sub-50ms filters across the full universe; one TypeScript field registry generates 8 downstream artifacts with zero drift.

•

Built a 5-tier GitHub Actions ETL DAG (20 workflows) on a self-hosted EC2 runner with VPC access to RDS, removing the hosted-runner timeout and cutting ETL compute cost to zero.

•

Shipped natural-language search (NL to screener DSL, 3-provider fallback) and an MCP server with OAuth, rate limiting and audit logging exposing 32 tools to Claude, ChatGPT and any MCP client.

•

Defined the strategy for one real-time inbox across WhatsApp, Instagram, Messenger and Zalo and shipped it: a ~208k LOC Next.js platform, 239 API routes, 5 messaging channels with 6 concurrent webhook sources, native in-WhatsApp payments (Razorpay, PayU, BillDesk, Cashfree via Meta Payments Hub), a visual chatbot builder and AI-assisted replies.

•

4-database persistence (PostgreSQL with 112 Prisma models, MongoDB, Redis, S3 media) behind ProxySQL, a Socket.IO real-time layer behind sticky-session Nginx, 5 OAuth flows with signed-webhook verification, and the AWS footprint codified in Terraform (Lambdas, SQS, EventBridge, ECS) with S3 remote state and DynamoDB locking.

•

SimpliDeliver Email (2026, in development): multi-tenant sending on Amazon SES with per-tenant identities, BYODKIM, custom MAIL FROM, an SNS to SQS event pipeline with DLQ, per-tenant suppression, and SES production access (50k/day) for an ESP-class workload.
